Quantum Circuits for the Schur Transform

Oliver Thomas

Quantum Engineering CDT University of Bristol

April 20, 2018

1 The Schur Transform

background.

2004 Bacon, Chuang & Harrow proposed a scheme for implementing the Schur transform in Poly time.

There are two distinct ways of performing the Schur transform on n qubits, it can either be built up from coupling all n qubits together in a single iteration which we call the spatial multiplexed approach. The other approach is performing Clebsch-Gordan (CG) transforms on the n qubits one at a time which we call the temporal multiplexed approach.

2 Streaming Scheme

Information processing tasks, such as classical compression gain a huge advantage implementing the process using a streaming scheme. Rather than start the compression on all the data to be sent and wait for it all to be compressed then send the data, as compression can be performed sequentially, compress part of the message and send it while compressing the next part. The Schur transform can also be thought of in this way. However, with compression it can still be useful to only compress part of the message, it is meaningless to perform only part of the Schur transform which suggests there may be a more optimal scheme opposed to streaming for implementing the Schur transform.

The streaming Schur transform is described in Fig. 1,

The aim of this report is to look at whether it is possible to achieve a log decrease in time by instead of coupling 1 qubit in at a time to the J & M registers, to pairing the couplings up in a **binary tree?** technique. To investigate the problem we look at how the complexity of performing the Clebsch-Gordan transform scales moving from coupling a single qubit to an arbitrary J&M to coupling arbitrary J&M registers together. looking at the pairing approach there is a symmetry in the fact that the max range of J&M values will be the same within each pairing which will help simplify the problem compared to any arbitrary J&M values.

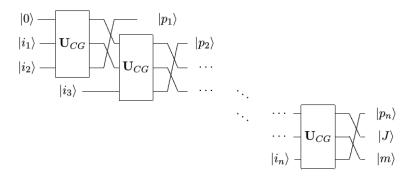

Figure 1: Streaming structure where the Schur transform is built up from consecutive Clebsch-Gordan transforms [1].

For the streaming scheme the U_{CG} block can be chosen so that it contains all of the gates for upto the n-th qubit meaning the same block can be repeated. Where the U_{CG} is the Clebsch-Gordan transform between the J & M registers and the k-th qubit $|i_k\rangle$.

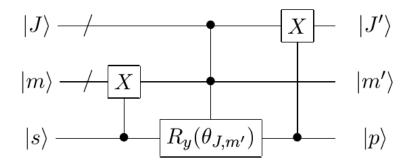

Figure 2: U_{CG} block, Qadder, controlled rotation, Qadder [1].

The controlled Rotation matrix, $R_y(\theta_{J,m'})$ Fig. 1 is the Clebsch-Gordan coefficients for coupling 1 qubit sequentially, given by,

$$R_{y}(\theta_{J,m'}) = \begin{bmatrix} \cos(\theta_{J,m'}) & -\sin(\theta_{J,m'}) \\ \sin(\theta_{J,m'}) & \cos(\theta_{J,m'}) \end{bmatrix} = \frac{1}{\sqrt{2J+1}} \begin{bmatrix} \sqrt{J+\frac{1}{2}+m'} & -\sqrt{J+\frac{1}{2}-m'} \\ \sqrt{J+\frac{1}{2}-m'} & \sqrt{J+\frac{1}{2}+m'} \end{bmatrix}$$
(1)

Where primed variables means after the angular momentum addition so J is the total J that the spin is coupling to, the system will have J' total angular momentum after the coupling. m is the z component of the system before and m' is the total z component after the coupling.

To build this circuit the rotation matrix, $R_y(\theta_{J,m'})$ needs to be calculated using Eq. 1, values here Eq. 11e, and a function to update the $|m\rangle$ and $|J\rangle$ registers is needed. Updating the registers can be implemented relatively simply using the coherent (meaning the registers are allowed to be in superpositions) equivalent of the digital full adders and subtractors. The complexity now has been reduced to implementing the Clebsch-Gordan transform, U_{CG} .

3 Implementing the Clebsch-Gordan Transform

The vanilla transform directly maps the computation basis states to a labeling of J and M values. The vanilla approach of calculating the CG coefficients and finding a gate decomposition does not scale well. A better approach is to use a scheme explicitly storing the values of J & M in registers.

The streaming scheme uses temporal multiplexing to perform the Schur transform in polynomial time if a recursive streaming scheme is used [2].

4 Spatially multiplexed Clebsch-Gordan transform for 2 qubits

The Clebsch-Gordan transform is a basis transformation into the Schur basis. The transform for 2 qubits is given by,

$$|J=1,M=+1\rangle = |00\rangle$$

$$|J=1,M==0\rangle = \frac{1}{\sqrt{2}}(|01\rangle + |10\rangle)$$

$$|J=1,M=-1\rangle = |11\rangle$$

$$|J=0,M==0\rangle = \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle)$$
(2a)

Throughout the encoding $|0\rangle = +1/2$, $|1\rangle = -1/2$ is used unless stated otherwise. The transform expressed as a matrix is,

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ 0 & 0 & 0 & 1 \\ 0 & \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 \end{bmatrix} \begin{bmatrix} |00\rangle \\ |01\rangle \\ |10\rangle \\ |11\rangle \end{bmatrix} = (\text{spin labeling}) \begin{bmatrix} |00\rangle \\ \frac{1}{\sqrt{2}}(|01\rangle + |10\rangle) \\ |11\rangle \\ \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle) \end{bmatrix} = \begin{bmatrix} |J=1, M=1\rangle \\ |J=1, M=0\rangle \\ |J=1, M=-1\rangle \\ |J=0, M=0\rangle \end{bmatrix}$$
(3)

Which can be implemented in a circuit as,

$$S_1 \xrightarrow{H} \qquad (4)$$

$$S_0 \xrightarrow{}$$

Figure 3: Schur transform for 2 qubits

Circuit for Clebsch-Gordan transform Fig. 3 contains 2 gates. As two-qubit (entangling) gates are much more expensive to perform compared to single qubit gates, the cost of the circuits discussed here will all be given in terms of the number of two-qubit gates.

4.1 Clebsch-Gordan coefficients for 3 qubits

The CG coefficients for three qubits are no multiplicities of 4 for J=3/2 and 2 multiplicities of 2 for J=1/2 Eq. 6c. The multiplicities, P are defined as J' - J the new J value minus the previous J value, the number of 1s in a P string is the number of multiplicities for that J value.

The matrix for the transform which takes the computational basis to the spin basis is,

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & 0 & \sqrt{\frac{1}{3}} & 0 & 0 & 0 \\ 0 & 0 & 0 & \sqrt{\frac{1}{3}} & 0 & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & \sqrt{\frac{2}{3}} & -\sqrt{\frac{1}{6}} & 0 & -\sqrt{\frac{1}{6}} & 0 & 0 & 0 \\ 0 & 0 & 0 & \sqrt{\frac{1}{6}} & 0 & \sqrt{\frac{1}{6}} & -\sqrt{\frac{2}{3}} & 0 \\ 0 & 0 & 0 & \frac{1}{\sqrt{2}} & 0 & -\frac{1}{\sqrt{2}} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{\sqrt{2}} & 0 & -\frac{1}{\sqrt{2}} & 0 & 0 \end{bmatrix} \begin{bmatrix} 000 \\ 001 \\ 011 \\ 100 \\ 101 \\ 110 \\ 111 \end{bmatrix} = \begin{bmatrix} |J = 3/2, M = 3/2 \rangle \\ |J = 3/2, M = 1/2 \rangle \\ |J = 3/2, M = -1/2 \rangle \\ |J = 3/2, M = -1/2 \rangle \\ |J = 1/2, M = -1/2, P = 0 \rangle \\ |J = 1/2, M = -1/2, P = 0 \rangle \\ |J = 1/2, M = -1/2, P = 1 \rangle \\ |J = 1/2, M = -1/2, P = 1 \rangle \end{bmatrix}$$
 (5)

The decomposition scheme for the n-qubit case could take at most $2^{n-1}(2^n-1)$ $C^{n-1}U$ gates [3], where $C^{n-1}U$ means a unitary acting on 1 qubit controlled on the other n-1 qubits. For 3 qubits this upper bound is 128 C^2U gates. It has been shown that in terms of gate count, $C^nU \sim 5C^{n-1}V$ where U&V are unitaries [4]. This means the maximum two-qubit gates needed would be 140 CU gates.

The decomposition of the 3 qubit CG transform was performed using the Givens rotation method for unitary decomposition into a gate-set. The matrix Eq. 5 can be expressed as a product of 19 C^2U gates (control-control-unitaries) which is $\sim 80 \ CU$ gates.

There are multiple ways of writing the spin basis, there is the traditional CG coefficients and there is also what is referred to here as the phase encoding Eq. 9. The phase encoded transform matrix will have a different decomposition as the shape of the matrix is different to the regular encoding.

4.2 Circuit for 3 qubit transform

See online [5] for Fortran code which implements the Givens rotation method to give the $19 C^2U$ gate decomposition. The majority of the gates are CNOT gates. This is mainly due to the re-ordering of the basis and is similar to the quantum Fourier transform (QFT). The QFT produces the output in reverse qubit order the actual number of gates required to do the transform is massively reduced. The overhead calculated here is due to the rearranging of the basis. This means that depending on what the transform is used the transform could be computed with less gates. For example, if the transform was only used to check if the state was in a particular J block but didn't need to know the specific M value the order afterwards wouldn't be as important reducing the CNOTs needed.

4.3 4 Qubit CG coefficients

The CG coefficients for four qubits contains 16 terms, 5 for J=2, 3 multiplicities of 3 for J=1, 2 multiplicities of 1 for J=0. The equations are given in Eq. 10f. In the J=1 case there are 3 acceptable bit strings, 0001, 0010, 0100 meaning there are 3 multiplicities present.

The decomposition scheme for the 4 qubit case could take at most $2^{n-1}(2^n-1)$ $C^{n-1}U$ gates [3], where n is 4 and. For 4 qubits this upper bound is 120 C^3U gates which could be up to ~ 3000 CU gates. In reality it will be much fewer gates as the matrix is sparse, however this suggests a different approach was needed.

4.4 Registering J & M explicitly ??, ??

The registered circuit, which takes in two qubits can be constructed from 11 gates if the m register is not compressed. The spatially multiplexed minimal gate explicit J & M 2 qubit transform is shown in ?? which contains 11 two-qubit gates. Another CNOT can be added to compress the M' register, which means using the same values for M'=0, see ?? for the 12 two-qubit gate circuit.

This spatial multiplexing approach only stores the final output values of the J & M registers.

5 General circuit for the Quantum Schur transform ??

Circuit uses the encoding for $|S\rangle: |0\rangle \mapsto Spin = +\frac{1}{2}, |1\rangle \mapsto Spin = -\frac{1}{2}$ and the same for $|P\rangle$.

The circuit adds the value of the spin to be added, $|S\rangle$, to the M register to calculate the M' register value. This is done by implementing the quantum reversible equivalent to the digital full adder.

The case where $|S\rangle = |0\rangle$ means the spin is $+\frac{1}{2}$ so to add $\frac{1}{2}$ to M, 1 is added to the m_0 qubit. The first Quantum Adder (QAdd) uses Toffoli gates controlled on $|s\rangle = |0\rangle$ (denoted by the white control circle) with the current m_0 value and C_0 (an ancilla carry). This ensures that the case when $m_0 = 1$ and 1 is added to it, m_0 goes to 0 and m_1 is increased using the carry as 001 + 1 = 010. The rest of the QAdd stages then just check the carry of the previous qubit to complete to M $+\frac{1}{2}$ addition as $|S\rangle = |0\rangle$ does not trigger any of the rest of the control gates.

The case where $|S\rangle = |1\rangle$ means the spin is $-\frac{1}{2}$ we do M $-\frac{1}{2}$ which is done by adding the binary string for $-\frac{1}{2}$ which is the all 1's string, 111. This time the very first QAdd does not trigger and $|s\rangle$ is then added to all of the bits of M using C-NOT gates with carries to check for overflow.

The Unitary is then performed on $|S\rangle$ depending on the values of the newly calculated M' and J registers using $R_y(\theta_{J,m'})$ Eq. 1. The J register is then updated to J' by adding the value of $|P\rangle$ to J using the QAdd sequence of gates.

To add the second qubit in the values of J' and M' are passed in as the initial register values. It is easy to extend this to many qubits being streamed in one at a time by carefully conditioning the controls on the unitaries, I think in the general case you need at most N controls for coupling up to N qubits in one at a time. The circuit written here has redundancy in the Identity and ZX gates appearing twice which is shown in the circuit for completeness??.

J_1	J_0	J	
0	0	0

Table 1: Tables giving binary Two's complement encoding to spin values of the M and J registers

6 Reduced general gate circuit for up to the 2 qubit Schur transform ??

Where V is the phase gate, $V = \begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}$, $V^{\dagger}V = I$ and $V^2 = Z$. V is used here to expand the double controlled Toffoli gate into single control gates in the quantum adder subroutine.

The W gate, $W^2 = HX$ with $W^{\dagger} = I$, is used to expand the HX gate into single control gates in the spin transform region.

The circuit checks that if $(m_1 \text{ XNOR } m_0)$ AND $(m_0 \text{ XOR } S_0)$ and will then change m_2 . Then m_1 is updated using $m_1 = m_0 \text{ XOR } S_0$. m_0 is always incremented by 1, if $|S\rangle = |0\rangle$ increment only m_0 by 1 corresponding to adding $\frac{1}{2}$ to the M register. $|S\rangle = |1\rangle$ corresponds to subtracting $\frac{1}{2}$ from the M register by adding the string 111 bitwise to M.

For the most positive values of M the Identity is performed on the spin corresponding to the strings $M = 001(J = \frac{1}{2}, M' = \frac{1}{2})$ for the first spin and M = 010(J = 1, M' = 1) for the second coupled in spins. The most negative values of M performs $XZ|S\rangle$ corresponding to the strings $M = 111(J = \frac{1}{2}, M' = \frac{1}{2})$

The most negative values of M performs $XZ|S\rangle$ corresponding to the strings $M = 111(J = \frac{1}{2}, M' = -\frac{1}{2})$ for the first spin and M = 110(J = 1, M' = -1) for the second spin. If M = 000(J = 0, M' = 0) do $XH|S\rangle$??.

A Appendix: Maths

A.1 3 Qubit transformation

This is the J=3/2 block

$$|J = 3/2, M = +3/2, P = 000\rangle = |000\rangle$$

$$|J = 3/2, M = +1/2, P = 000\rangle = \sqrt{\frac{1}{3}}(|001\rangle + |010\rangle + |100\rangle)$$

$$|J = 3/2, M = -1/2, P = 000\rangle = \sqrt{\frac{1}{3}}(|110\rangle + |011\rangle + |101\rangle)$$

$$|J = 3/2, M = -3/2, P = 000\rangle = |111\rangle$$
(6a)

This is the J=1/2 block from J=1, multiplicity zero

$$|J = 1/2, M = +1/2, P = 001\rangle = +\sqrt{\frac{2}{3}}|001\rangle - \sqrt{\frac{1}{6}}(|010\rangle + |100\rangle)$$

$$|J = 1/2, M = -1/2, P = 001\rangle = -\sqrt{\frac{2}{3}}|110\rangle + \sqrt{\frac{1}{6}}(|011\rangle + |101\rangle)$$
(6b)

This is the J=1/2 block from J=0, multiplicity one

$$|J = 1/2, M = +1/2, P = 010\rangle = \frac{1}{\sqrt{2}}(|010\rangle - |100\rangle)$$

$$|J = 1/2, M = -1/2, P = 010\rangle = \frac{1}{\sqrt{2}}(|011\rangle - |101\rangle)$$
(6c)

The CG transform for 3 qubits Eq. 5 can be rearranged to a block diagonal form which looks like it could be implemented in a circuit.

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \sqrt{\frac{2}{3}} & -\sqrt{\frac{1}{6}} & -\sqrt{\frac{1}{6}} & 0 & 0 & 0 & 0 \\ 0 & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 & 0 \\ 0 & 0 & 0 & 0 & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{3}} & 0 \\ 0 & 0 & 0 & 0 & \sqrt{\frac{1}{6}} & \sqrt{\frac{1}{6}} & -\sqrt{\frac{2}{3}} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 000 \\ 001 \\ 010 \\ 100 \\ 011 \\ 110 \\ 111 \end{bmatrix}$$

$$(7)$$

A.2 3 Qubit phase encoding

This is the J=3/2 block

$$|J = 3/2, M = +3/2, P = 000\rangle = |000\rangle$$

$$|J = 3/2, M = +1/2, P = 000\rangle = \sqrt{\frac{1}{3}}(|001\rangle + |010\rangle + |100\rangle)$$

$$|J = 3/2, M = -1/2, P = 000\rangle = \sqrt{\frac{1}{3}}(|110\rangle + |011\rangle + |101\rangle)$$

$$|J = 3/2, M = -3/2, P = 000\rangle = |111\rangle$$
(8a)

This is the J=1/2 block from J=1, multiplicity zero

$$|J = 1/2, M = +1/2, P = 001\rangle = \frac{1}{\sqrt{3}}(|001\rangle + e^{2\pi i/3}|100\rangle + e^{4\pi i/3}|010\rangle)$$

$$|J = 1/2, M = -1/2, P = 001\rangle = \frac{1}{\sqrt{3}}(|011\rangle + e^{2\pi i/3}|101\rangle + e^{4\pi i/3}|110\rangle)$$
(8b)

This is the J=1/2 block from J=0, multiplicity one

$$|J = 1/2, M = +1/2, P = 010\rangle = \frac{1}{\sqrt{3}}(|001\rangle + e^{4\pi i/3}|100\rangle + e^{2\pi i/3}|010\rangle)$$

$$|J = 1/2, M = -1/2, P = 010\rangle = \frac{1}{\sqrt{3}}(|011\rangle + e^{4\pi i/3}|101\rangle + e^{2\pi i/3}|110\rangle)$$
(8c)

The phase encoding matrix is given by,

$$\frac{1}{\sqrt{3}} \begin{bmatrix}
\sqrt{3} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 1 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 1 & 1 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sqrt{3} \\
0 & e^{2\pi i/3} & e^{4\pi i/3} & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & e^{2\pi i/3} & 0 & e^{4\pi i/3} & 1 & 0 \\
0 & 0 & 0 & e^{4\pi i/3} & e^{2\pi i/3} & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & e^{4\pi i/3} & 0 & e^{2\pi i/3} & 1 & 0
\end{bmatrix} \begin{bmatrix}
000 \\ 001 \\ 011 \\ 100 \\ 101 \\ 110 \\ 111 \end{bmatrix} = \begin{bmatrix}
|J = 3/2, M = 3/2\rangle \\ |J = 3/2, M = -1/2\rangle \\ |J = 3/2, M = -1/2\rangle \\ |J = 3/2, M = -3/2\rangle \\ |J = 1/2, M = -1/2, P = 0\rangle \\ |J = 1/2, M = -1/2, P = 0\rangle \\ |J = 1/2, M = 1/2, P = 1\rangle \\ |J = 1/2, M = -1/2, P = 1\rangle \end{bmatrix} (9)$$

Where this is a different form to the other basis for 3 qubits Eq. 5.

A.3 4 Qubit CG coefficients

The J=2 block, P=0000, (J=1/2, J=1, J=3/2, J=2)

$$|J=2, M=+2, P=0000\rangle = |0000\rangle$$

$$|J=2, M=+1, P=0000\rangle = \frac{1}{2}(|0001\rangle + |0010\rangle + |0100\rangle + |1000\rangle)$$

$$|J=2, M=0, P=0000\rangle = \sqrt{\frac{1}{6}}(|0011\rangle + |0101\rangle + |1001\rangle + |1100\rangle + |1010\rangle + |0110\rangle)$$

$$|J=2, M=-1, P=0000\rangle = \frac{1}{2}(|1110\rangle + |1101\rangle + |1011\rangle + |0111\rangle)$$

$$|J=2, M=-2, P=0000\rangle = |1111\rangle$$

$$(10a)$$

The J=1 (0) block, P=0001, (J=1/2, J=1, J=3/2, J=1)

$$|J = 1, M = +1, P = 0001\rangle = +\sqrt{\frac{3}{4}}|0001\rangle - \sqrt{\frac{1}{12}}(|0010\rangle + |0100\rangle + |1000\rangle)$$

$$|J = 1, M = 0, P = 0001\rangle = \sqrt{\frac{1}{6}}(|0011\rangle + |0101\rangle + |1001\rangle - |1100\rangle - |1010\rangle - |0110\rangle)$$

$$|J = 1, M = -1, P = 0001\rangle = -\sqrt{\frac{3}{4}}|1110\rangle + \sqrt{\frac{1}{12}}(|1101\rangle + |1011\rangle + |0111\rangle)$$
(10b)

The J=1 (1) block, P=0010, (J=1/2, J=1, J=1/2, J=1)

$$|J = 1, M = +1, P = 0010\rangle = +\sqrt{\frac{2}{3}}|0010\rangle - \sqrt{\frac{1}{6}}(|0100\rangle + |1000\rangle)$$

$$|J = 1, M = -1, P = 0010\rangle = \sqrt{\frac{1}{3}}(|0011\rangle - |1100\rangle) + \sqrt{\frac{1}{12}}(|0110\rangle + |1010\rangle - |0101\rangle - |1001\rangle)$$

$$|J = 1, M = -1, P = 0010\rangle = -\sqrt{\frac{2}{3}}|1101\rangle + \sqrt{\frac{1}{6}}(|1011\rangle + |0111\rangle)$$
(10c)

The J=1 (2) block, P=0100, (J=1/2, J=0, J=1/2, J=1)

$$|J = 1, M = +1, P = 0100\rangle = +\sqrt{\frac{1}{2}}(|0100\rangle - |1000\rangle)$$

$$|J = 1, M = 0, P = 0100\rangle = \frac{1}{2}(|0101\rangle - |1001\rangle + |0110\rangle - |1010\rangle)$$

$$|J = 1, M = -1, P = 0100\rangle = -\sqrt{\frac{1}{2}}(|0111\rangle - |1011\rangle)$$
(10d)

The J=0 block, P=0011, (J=1/2, J=1, J=1/2, J=0)

$$|J=0, M=0, P=0011\rangle = \sqrt{\frac{1}{3}}(|0011\rangle + |1100\rangle) - \sqrt{\frac{1}{12}}(|0101\rangle + |1001\rangle + |0110\rangle + |1010\rangle) \quad (10e)$$

The J=0 block, P=0101, (J=1/2, J=0, J=1/2, J=0)

$$|J=0, M=0, P=0101\rangle = \frac{1}{2}(|0101\rangle - |1001\rangle - |0110\rangle + |1010\rangle)$$
 (10f)

A.4 Rotation matrix for J & M values

J=0 values

$$|J = 0, M' = +1/2\rangle = R = I$$

 $|J = 0, M' = -1/2\rangle = R = XZ$ (11a)

J=1/2 values

$$|J = 1/2, M' = +1\rangle = R = I$$

$$|J = 1/2, M' = 0\rangle = R = XH$$

$$|J = 1/2, M' = -1\rangle = R = XZ$$
(11b)

J=1 values

$$|J = 1, M' = +3/2\rangle = R = I$$

$$|J = 1, M' = +1/2\rangle = R = \frac{1}{\sqrt{3}} \begin{bmatrix} \sqrt{2} & -1\\ 1 & \sqrt{2} \end{bmatrix}$$

$$|J = 1, M' = -1/2\rangle = R = \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & -\sqrt{2}\\ \sqrt{2} & 1 \end{bmatrix}$$

$$|J = 1, M' = -3/2\rangle = R = XZ$$
(11c)

J=3/2 values

$$|J = 3/2, M' = +2\rangle = R = I$$

$$|J = 3/2, M' = +1\rangle = R = \frac{1}{2} \begin{bmatrix} \sqrt{3} & -1\\ 1 & \sqrt{3} \end{bmatrix}$$

$$|J = 3/2, M' = 0\rangle = R = XH$$

$$|J = 3/2, M' = -1\rangle = R = \frac{1}{2} \begin{bmatrix} 1 & -\sqrt{3}\\ \sqrt{3} & 1 \end{bmatrix}$$

$$|J = 3/2, M' = -2\rangle = R = XZ$$
(11d)

J=2 values

$$|J = 2, M' = +5/2\rangle = R = I$$

$$|J = 2, M' = +3/2\rangle = R = \frac{1}{\sqrt{5}} \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$$

$$|J = 2, M' = +1/2\rangle = R = \frac{1}{\sqrt{5}} \begin{bmatrix} \sqrt{3} & -\sqrt{2} \\ \sqrt{2} & \sqrt{3} \end{bmatrix}$$

$$|J = 2, M' = -1/2\rangle = R = \frac{1}{\sqrt{5}} \begin{bmatrix} \sqrt{2} & -\sqrt{3} \\ \sqrt{3} & \sqrt{2} \end{bmatrix}$$

$$|J = 2, M' = -3/2\rangle = R = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & -2 \\ 2 & 1 \end{bmatrix}$$

$$|J = 2, M' = -5/2\rangle = R = XZ$$
(11e)
